

AirFocus SS

SINGLE-SPEED OVERHEAD FAN

Quick-reference guide to...

INSTALLATION

CONGRATULATIONS!

You've made a great choice with AIR MOVEMENT SOLUTIONS.

Here's how to **GET STARTED** enjoying your fan:

- 1) Unpack the fan onto a soft, protective surface and use the foam wedges included in the packaging to stand the fan securely on its edge, with the gap in the safety grate positioned near the top (12-o-clock).
- 2) Inspect the safety grate for movement during shipping and adjust it, if necessary, to ensure that there is approximately 1" of clearance to the blades all the way around.
- 4) Fasten four (4) mounting Safe Straps securely to the ceiling structure in a square pattern measuring approximately 60" - 66" on each side. Hanging the fan at a tilted angle can be achieved by folding or tying straps to different lengths. Do not cut the straps.
- 5) Use the quick links to connect the eye bolts of the fan assembly to the Safe Straps. If installing the fan at a tilted angle, locate the motor assembly at the lowest possible position.
- 6) Check that the fan blades spin freely and are unobstructed during rotation.
- 7) Route the power cable from the fan directly to a 20-amp max. 120V/1P power source. If an extension cord must be used, employ 12/3 cable of the shortest length possible. Operating with reduced voltage will reduce product life. Use zip ties, wire staples, etc. to secure the cable and ensure that it cannot come into contact with the fan blades or other equipment or material that may damage the cable.
- 8) Test the operation of the fan. Throughout the life of the fan, clean the fan blades periodically to maintain the fan's efficiency.
